

PauseAm integration evidence

Ask before you pay. | NAIC 2026 / PS2 | 3 October 2026

Implemented models

English ASR: NCAIR1/NigerianAccentedEnglish, revision 3c52c6e6c9ec508014a7b9db6a42b503b8930dff. Text: NCAIR1/N-ATLaS, revision e294476928aca9030e924ca27bb8e085e8581273. Authenticated SecretVM inference runs behind server-side adapters. Corrected questions use constrained model relevance checking against reviewed guidance. Q4_K_M CPU conversion is quantization, not fine-tuning.

[Integration evidence PDF](#)

Architecture, model identities, code, redacted configuration, real traces, screenshots and limitations.

[Live request logs and API response samples](#)

Ten engineering checks, including four genuine N-ATLaS text requests with HTTP status, model revision, trace IDs and latency.

[Authenticated text-host request evidence](#)

Six real text requests plus two pre-inference guards. Successful inference took 6,141-6,754 ms in this run.

[English ASR engineering evidence](#)

Real health, privacy and silent-audio error checks; owner confirmation is identified separately.

[Working application screenshot](#)

Actual mobile application state, not a fabricated transcript or participant result.

[Reproducible model-host verification script](#)

Health, pinned model identity, genuine request checks and timings.

Claims and current limits

English only. Official N-ATLaS API requests and fine-tuning are not demonstrated. Organiser acceptance of self-hosted official ASR weights as the required service remains pending. Device speech and separately labelled Microsoft demo narration are not N-ATLaS TTS. These logs are engineering evidence, not independent participant validation.

The owner reports 25 testers have tried the app; feedback and session evidence await review. No participant success rate or minimum-50 claim is made. No secrets, raw audio or private banking records are included.
